-- FUNCTION: Riboflavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from 5-amino-6-(1'-D)-ribityl-amino-2,4(1H,3H)-pyrimidinedione and L-3,4-dihydrohy-2-butanone-4-phosphate via 6,7-dimethyl-8-lumazine. The beta subunit catalyzes the condensation of 5-amino-6-(1'-D)-ribityl-amino-2,4(1H,3H)-pyrimidinedione with L-3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By similarity).

-- CAPALYTIC ACTIVITY: 26,7-dimethyl-8-lu-pribityl-lumazine -- riboflavin +4-(1-D-ribityl-amino)-5-amino-2,6-dihydroxypyrimidine.

-- PATHWAY: Riboflavin biosynthesis; last step.

-- SIMILARITY: BELONGS TO THE DMRL SYNTHASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE-98295987; pubMed-9634230;
